**D3 Deliverable:**

The learned decision tree from the ID3 algorithm is equivalent to one member of the learned version space from the Candidate Elimination algorithm. In particular, the learned decision tree is equivalent to the hypothesis  $\langle \text{sunny}, ?, ?, ?, ? \rangle$ , a hypothesis in the general boundary,  $G$ . However, this is only one hypothesis in the learned version space, meaning that the learned decision tree is less specific and more biased than the learned version space.
